LLM agent (judgment)
Load any export; decode points; declare quantity and unit; fix or accept each issue with a reason
Add inputs and models; mark inputs known in advance
Explain; approval is logged
Act on alerts: fix the sensor or retrain
↓ declarations, decisions
↑ issues, results, alerts
bemlops (same checks for every model)
Check
declarations vs physics; sensor and export faults
Prepare
causal cleaning; units; resampling
Inputs
shifted by the horizon; reach audited
Evaluate
time order; strongest baseline; backtest
Gate, register
five gates; versions; rollback
Serve, monitor
live checks; drift vs test error and baseline
Retrain
champion vs challenger
new data: retrain, re-evaluate, re-gate
Run record: declarations, notes, accepted issues, data fingerprints, settings, metrics, gates, code version → report, model card, registry
